Management of peri-implant diseases

Key aspects in the management of peri-implant diseases:

- Interventions for the preservation of peri-implant tissue health before implantation.
- Risk factor assessment.
- Behavioural modification, health monitoring, appropriate preventive interventions.
- Importance of soft tissues in prevention of peri-implant diseases.
- Peri-implant tissue health, peri-implant mucositis and peri-implantitis represent a continuum.
- Adequate self-performed and professionally delivered OH.
- SPIC (Supportive Peri-Implant Care) as offered to every patient who receives dental implants.
- Treatment of peri-implant mucositis as a key strategy in the prevention of the onset of peri-implantitis.
